

## Soil Oxidant Demand Test Kit – SOD-25

The SOD-25 Soil Oxidant Demand (SOD) test kit is a simple to use tool that measures the permanganate oxidant demand exerted by reduced organic and inorganic soil constituents over a 48 hour period. This measurement is intended to rapidly determine the applicability of in situ chemical oxidation (ISCO) with permanganate to provide preliminary design and cost information.

The test procedure is based on a modified version of the USEPA method for determining soil oxidant demand with potassium permanganate. Simply add site soil and water to the reaction tubes, and the results are available by comparing the viewing tube to a color comparator chart. Each reaction tube includes a pre-weighed amount of potassium permanganate, so there is no need to handle oxidants and other reagents.

In-situ chemical oxidation using permanganate is an established remediation technology for the treatment of chlorinated solvents such as tetrachloroethene (PCE) and trichloroethene (TCE). The soil oxidant demand, also known as natural oxidant demand, has been determined by USEPA to be the most important criteria in the overall success of an ISCO remedy. Oxidation Systems designed this simple to use and very effective SOD test to provide a screening level measurement of this important parameter.

## Description

The Oxidation Systems Soil Oxidant Demand (SOD) Test Kit (SOD-25) includes everything that is necessary to conduct 25 SOD tests for permanganate. The SOD-25 includes the following:

- 125 reaction tubes (0 – 20 g/kg  $\text{KMnO}_4$ )
- 125 clear 9 ml “viewing tubes”
- Test tube rack
- 10-ml syringe w/ 25 filter cartridges (0.45  $\mu$ )
- Oxidant/reagents
- 20-ml syringe
- Color comparator chart
- Manual, calculation worksheet, MSDS

SOD testing results are reported in units of g/kg (g of permanganate consumed per kg of soil). This simple and inexpensive SOD test is a good screening level tool that can provide a “go / no-go” decision to aid remediation designers and stake-holders who are considering ISCO for a particular site.

SOD-5 includes all reagents and materials necessary for 5 SOD tests
